

Learning Styles Thoughts

I have always not cared about learning styles since I never had a need to. I always did fine in school whether or not the material was presented in a certain way. However, I did think that hand-on experience was the best way to learn something since it has worked greatly for me when learning how to cook, draw, and play piano. I later found out that this is just practicing and through practicing, you always discover new ways to do things which are learning. So when finding out I have a visual learning style from taking the test, it made sense why I could learn so much from practicing. Practicing greatly uses all three ways of learning styles but can change how much each is used depending on the subject. For instance, cooking may use more visual and tactile learning than playing the piano which uses more auditory and tactile. Along with this, Cindi May's article "The Problem With Learning Styles" strengthens my belief on learning styles since studies show that learning styles have no proof of impacting learning. This leads me to believe that learning styles are purely a preference of learning. Therefore, no matter what the material is, everyone will learn the same despite a difference of learning style.

What's Your Learning Style? The Results

[Printer Friendly Version](#)

Your Scores:

- Auditory: 25%
- Visual: 55%
- Tactile: 20%

You are a **Visual** learner! Check out the information below, or [view all of the learning styles](#).
